More about our anti-clone technology

Alarm scenarios can be created to alert management of the use of unauthorised fobs

Attempting to use an unauthorized clone of a fob will alert the system and prevent its use.

Use of unauthorised fobs can be seen in the events log

Function can be deactivated by the property manager remotely via BATICONNECT® CLOUD.

What changes for the manager or housing association

SCENARIO 1

- 1 A criminal gets hold of a resident's fob whilst the resident is on the train and makes a copy without the resident knowing.**

The resident gets home and scans their fob and has access to their property.
- 2 Later that evening the criminal attempts to gain entry using the cloned fob.**

The criminals cloned fob does not work and they can't get in. The property is secure!
- 3 The property has the anti-clone alarm scenario set up and so management and the concierge are instantly alerted of a use of a cloned fob, concierge immediately calls the police and now the criminal has been arrested!**

Management can receive an email in real-time of its use. Management is provided with the date and time, property address and the access point of the attempted access.

SCENARIO 2

- 1 The resident is subletting their apartment without authorisation. The tenant is unaware of this.**

Resident instructs their tenant to clone their fob.
- 2 Tenant attempts to gain access to the property using the cloned fob.**

Tenant complains their fob does not work.
- 3 Manager checks the log for the cause of the failure.**

The caretaker / manager will check the event log on BATICONNECT to observe the latest access events. The latest event observed states " Suspected APASS forgery". The caretaker / manager can then determine that the fob used by the resident was a clone.
- 4 Management investigates further and is now aware that one of their residents has been subletting without authorisation.**

The property is now under control! As a result the residents are now safe and secure!

How the technology works at a glance

1 A fob is presented to the reader

2 Copy can be detected when either an original or copied fob is presented to the reader

3 The fob is read, and allowed entry. Also notifies the system of the serial number, and issues a new rolling code

4 The fob with the new rolling code (original or copied) will now carry that serial number, and others will be rejected

REGULAR UPDATES

Our system is fully cloud based, granting the ability to continuously update the system. Providing the system with new software, features and enhancing its security. This means that our systems are fully future proofed, so that the end user can have peace of mind that their system is always working at its best!
